

## ABSTRACT OF THE DISCLOSURE

In a communication network managing system, at a network manager, a management section concentratedly  
5 manages QoS (Quality of Service) capability management information from element managers ( $i$  represents an integer selected from 1 through  $N$  where  $N$  is an integer equal or larger than 2), a request reception section receives a request for a target QoS capability, and a selection and  
10 notification section selects a candidate subnetwork such as to satisfy the target QoS capability for which the request has been received by the request reception section, and notifies the corresponding element managers of information about the selection. At the individual  
15 element manager, based on the selection information from the selection and notification section of the network manager, a control section controls the corresponding subnetwork.
